Panasonic

Battery pack

Most batteries are used in the form of battery packs and installed in devices. When the battery pack is used, the type of battery, number of cells, shape of the pack, constituent parts of the pack, etc, are determined by the ratings (voltage, load current) of the device, charge specifications, space available in the battery compartment, use conditions, etc. At Panasonic, we are designing and manufacturing battery packs by taking the safety and reliability of the batteries into considera

It is recommended that a thermistor for temperature detection, and a thermal protector or PTC element for protection from temperature rises and external short-circuiting, are installed in a nickel-metal hydride battery pack. Also, safety protection circuits are required for safety purposes.

 $\ensuremath{\bigcirc}$ Recommended charging method: Enables Panasonic batteries to display full performance. O Acceptable charging method: Usable depending on the use conditions of the equipment

* 1 • It is necessary to adopt a battery pack construction that allows the temperature detection element (sensor) to reliably detect the battery temperature. * 2 • This method is not appropriate for applications in which the timer is frequently reset (charge is restarted).

2 • This mentiod is not appropriate for applications in which the time is negutaring reset (Large Is testarted).
If requesting the timesetting of the time is required, or if a charge rate higher than 0.2 it is adopted for equipment reasons (for example, timer-controlled charge at 0.3 tt), it is necessary to combine this method with temperature control.
• Please note that the overcharge performance will vary according to the battery type.
• 3 • Please note that, if a charge rate higher than 0.1 it is adopted for requipment reasons (and the overcharge rate ligher than 0.1 it is adopted for reason of equipment, the overcharge performance and temperature rise characteristics will vary according to the battery type. Consult Panasonic before defining the specifications.

• If a large number of battery cells are used, or if batteries having a high rated capacity are used, or if the heat dissipation of the battery pack is poor, the battery generate heat even when charged at 0.1 lt. In such cases, it is necessary to re-design the battery pack for better heat dissipation or to lower the charge current. Design the battery pack so that the battery temperature rise at saturation is not higher than 50 °C.

Safety precautions

| | Nickel metal hydride batteries |
|--------|--|
| DANGER | Mishandling the battery may bring generate a short circuit, cause its insulation to melt, or cause damage to its safety valve or safety mechanism, which may in turn cause the battery to leak, generate heat, or explode. Be sure to follow the instructions listed below when using the battery: Do not place the battery in fire or heat up the battery. Never insert the battery with its positive and negative poles reversed. The battery has a predetermined polarity. If, when setting the battery in a battery charger or appliance, it cannot readily be fitted, do not insert the battery by force, instead, check the battery's polarity. Do not connect the battery to a power receptacle or directly to a car's cigarette lighter. Do not connect the positive terminal and the negative terminal of the battery to each other with any metal object such as a wire. Do not carry or store the batteries together with necklaces or other metal objects. Do not solder any objects directly onto the battery. When charging the battery incorporates a gas-venting structure of discharge internal gases. For this reason, do not deform the positive electrode. Never install the battery in charging is electrolyte. This electrolyte may result in the loss of eyesight if it comes into contact with an eye. In such cases, do not rub the eye, but immediately wash the eye with clean water and then consult a doctor. |
| | When electrolyte leakage, discoloration, deformation, or other unusual symptom is detected on the battery, do not use it. Do not expose the battery to water or salt water, or allow the battery to get wet. Doing so may cause the battery to generate heat or rust. Do not peel off or scratch the outer covering tube of the battery. Doing so can easily cause the battery to generate heat or rust. Do not peel off or scratch the outer covering tube of the battery. Doing so can easily cause the battery to generate heat, or explode. When a battery charge exceeds the specified charge time, stop charging the battery. If charged beyond the specified charge time, the battery will become overcharged, which may cause the battery to leak or generate heat. The battery contains an alkaline electrolyte. When this electrolyte contacts the skin or clothes, immediately wash them with clean water. Otherwise, the skin or clothes may be damaged Store the batteries in a location out of reach of infants. If an infant should swallow a battery, consult a doctor immediately. |

General description

Adaptable to compact sizes and high capacities according to applications

Nickel metal hydride batteries can offer well-balanced factors including high capacity, and high cost performance, and are most suitable for mobile equipment, video equipment, acoustic equipment, electrically-powered equipment, and other applications. The battery is also applicable to various backup devices such as UPS, enabling the devices to achieve savings in space and weight.

Back-up type

A design that achieves long life for back-up (Good for Emergency-use)

Features • Best suited to a wide variety of equipment. • Small size, light weight and downsizing possible. • Energy saving, Long life.

• Capable of delivering excellent charge characteristics at high temperature (75 °C).

High temperature & long life type

Most suitable for guide lamps, emergency lamps, other nickel cadmium battery subsitutions. This type has a long-life and is capable of delivering excellent charge characteristics at high temperature (60 °C).

• Application: Emergency light, Guidance light, Led light, Information equipment FTTX (HUB.ONRU), Back up base station, Security, Emergency light/Guidance light, Two way radio, Server, Memory backup, Automated Teller Machine (ATM), Point Of Sales system (POS), Vending machine, Medical equipment, other
